On Site Effluent Assessment for Subdivision

Ingleside Release Area

July 2015

Document Set ID: 5177584
Version: 1, Version Date: 22/07/2015

IMPORTANT NOTICE

This report is confidential and is provided solely for the purposes of [assessing effluent risk at a subdivision scale]. This report is provided pursuant to a Consultancy Agreement between SMEC Australia Pty Limited ("SMEC") and Department of Planning and Environment (DPE) under which SMEC undertook to perform a specific and limited task for DPE. This report is strictly limited to the matters stated in it and subject to the various assumptions, qualifications and limitations in it and does not apply by implication to other matters. SMEC makes no representation that the scope, assumptions, qualifications and exclusions set out in this report will be suitable or sufficient for other purposes nor that the content of the report covers all matters which you may regard as material for your purposes.

This report must be read as a whole. The executive summary is not a substitute for this. Any subsequent report must be read in conjunction with this report.

The report supersedes all previous draft or interim reports, whether written or presented orally, before the date of this report. This report has not and will not be updated for events or transactions occurring after the date of the report or any other matters which might have a material effect on its contents or which come to light after the date of the report. SMEC is not obliged to inform you of any such event, transaction or matter nor to update the report for anything that occurs, or of which SMEC becomes aware, after the date of this report.

Unless expressly agreed otherwise in writing, SMEC does not accept a duty of care or any other legal responsibility whatsoever in relation to this report, or any related enquiries, advice or other work, nor does SMEC make any representation in connection with this report, to any person other than DPE. Any other person who receives a draft or a copy of this report (or any part of it) or discusses it (or any part of it) or any related matter with SMEC, does so on the basis that he or she acknowledges and accepts that he or she may not rely on this report nor on any related information or advice given by SMEC for any purpose whatsoever.

LIST OF FIGURES

LIST OF TABLES

1. INTRODUCTION

1.1. Background of Project

SMEC Australia Pty Ltd (SMEC) was engaged by the NSW Department of Planning and Environment (DP&E) to prepare an On Site Effluent Subdivision Assessment for development of the Ingleside Release Area, Ingleside, NSW. The Ingleside precinct occupies approximately 700 hectares within the Pittwater Local Government Area (LGA) and is located approximately 20 km north-east of the Sydney CBD. This report is a technical paper developed to inform the precinct planning process for Ingleside. The precinct planning is being developed as a partnership between the DP&E, Pittwater Council and Urban Growth NSW.

1.2. Purpose

The On Site Effluent Subdivision Assessment is required to develop an understanding of the capacity and constraints associated with on site treatment of residential effluent within the land identified as rural landscape under the Pittwater Local Environmental Plan 2014. The scale of investigation and reporting works has been applied at a subdivision level for three sub-precinct locations containing Rural Landscape and where the proposed reticulated sewerage network may not provide coverage (Figure 1). The three sub-precinct locations are:

- Wirreanda Valley (Wirreanda Road and Addison Road)
- North Ingleside (north of Cicada Glen Road)
- Bayview (Walter Road)

The areas to be serviced within the above sub precinct areas are based on high level service strategies received from Sydney Water.

In the absence of detailed service level or service delivery timeframes this report has assumed that these areas will require conventional asset life cycles.

1.3. Scope of Works

A summary of the key activities for this scope of works is as follows:

- Desktop study to identify representative and accessible assessment sites in accordance with adopted guidelines
- Field works preparation, service locating, drill rig, soil sampling and site walkover
- Laboratory analysis of soil
- On-site Sewage Management Site and Soil Assessment report
- Liaison with the key stakeholders throughout the process including the project manager, relevant government agencies, service providers and the master planner.

1.4. Technical Framework

The site and soil assessment is generally based on the guidance for subdivision scale assessment as provided in *Environment & Health Protection Guidelines On-site Sewage Management for Single Households* (Department of Local Government, 1998).

2. SITE INFORMATION

2.1. Subject Site Description

For the purposes of assessment and reporting, the study area comprises the following sub-precincts and lands identified as Rural Landscape (Figure 1) in accordance with the Pittwater LEP 2014:

- Wirreanda Valley
- North Ingleside
- Bayview

The study areas are made up of individual sites with highly variable size blocks. The average size block for the 31 Lots in Wirreanda Valley is 2.3 hectares, 9 Lots in North Ingleside is 2.1 and the 28 Lots in Bayview is 1.4 hectares.

2.2. Environmental Setting

Collectively, the sub-precincts are generally bordered by the following:

- West - Wirreanda Creek and the Ku-ring-gai Chase National Park.
- North - Ku-ring-gai Chase National Park and the suburb of Church Point.
- East – Warriewood Escarpment, Katandra Bushland Sanctuary and the suburb of Mona Vale.
- South - Garigal National Park and the suburb of Elanora Heights.

It is understood that the subject area adjacent to the study area will accommodate a mixture of land uses including environmental living, low and medium density dwellings (and a range of other land uses) in the future.

2.3. Topography

The landscape of the subject area generally consists of relatively steep areas close to the Warriewood/Ingleside Escarpment, through to lower lying areas around the centre of the precinct (Powder Works Road, McLean Street etc.). Mona Vale Road dissects the subject area and generally follows the ridge line through the subject area. Elevations throughout the subject area generally range from a high of 200 m above sea level near the Baha'i Temple to low of 80 m above sea level in the area around Emmaus Road. In general, the subject area north of Mona Vale Road falls to towards the north and north-east while the subject area south of Mona Vale Road falls to towards the south-east.

There are two creek lines located within the subject area north of Mona Vale Road. Wirreanda Creek follows the western edge of the subject area and flows to the north before discharging into McCarrs Creek, while Cicada Glen Creek flows to the north from Chiltern Road before also discharging into McCarrs Creek.

Figure 1 identifies the creek lines and topography in relation to the subject area.

2.4. Geology

The *Sydney 1:100 000 Series Geological Sheet* indicates that the study area is entirely underlain by the Hawkesbury Sandstone formation (mapping unit Rh) of the Wianamatta Group from the Triassic Period.

The Hawkesbury Sandstone formation typically comprises medium to coarse-grained quartz sandstone with very minor shale and laminate lenses.

2.5. Hydrogeology

SMEC completed a search of the Department of Water and Energy Online Database to identify groundwater bores within the subject area. The search indicated that there are 50 registered boreholes in the subject area (Figure 2). NSW Office of Water bore summaries for registered bores within the Ingleside release area are listed in Appendix E.

Regional groundwater is expected to generally flow to the north-east in accordance with the general site topography with localised variations in areas located nearer to water bodies and creek lines.

Water quality information contained within the bore logs is limited. However, the information that is available identifies salinity characteristics as good to fresh which indicates reasonable water quality and non-saline groundwater conditions. This is anticipated given the geology of the subject area.

The recorded bore depths range from 5.3 mbgl to 210 mbgl with historical standing water levels within the bores ranging from 14 mbgl to 105 mbgl. The recorded bore depths and water levels indicate that there is likely more than one aquifer within the subject area.

2.6. Soil Landscapes

The subject area comprises a variety of soil landscapes recognised under the Soil Landscapes of the Sydney 1:100 000 Sheet. Soil landscapes mapped within the subject area include Gymea, Oxford Falls, Hawkesbury and Somersby.

Descriptions and characteristics of the various soil landscapes identified within the subject area are provided in Table 1. Figure 3 identifies the locations of the various soil landscape groups mapped and sampled throughout the subject area.

Table 1 Soils descriptions under the Soil Landscapes of the Sydney 1:100 000 Sheet

Soil Type	Landscape	Soils
Somersby	Gently undulating to rolling rises on deeply weathered Hawkesbury Sandstone plateau. Local relief to 40 m, slopes <15%. Rock outcrop is absent. Crests are broad and convex, valleys are narrow and concave. Extensively cleared, low eucalypt open-woodland and scrubland.	Moderately deep to deep (100-300 cm) Red Earths (Gn2.14) and Yellow Earths (Gn 2.24, Gn2.21) overlying laterite gravels and clays on crests and upper slopes; Yellow Earths (Gn2.21, Gn2.24) and Earthy Sands (Uc5.11, Uc5.22) on mid slopes; Grey Earths (Gn2.81), Leached Sands (Uc2.23) and Siliceous Sands (Uc1.22) on lower slopes and drainage lines; Gleyed Podzolic Soils (Dg3.82, Dg4.51) in low lying poorly drained areas.
Oxford Falls	Hanging valleys on Hawkesbury Sandstone. Local relief <80 m, slopes <15%. Occasional broad benches and broken scarps. Valley floors are relatively wide, gently inclined and often poorly drained. Low eucalypt woodland, scrub heathland and sedgeland.	Moderately deep to deep (50 >150 cm) Earthy Sands (Ue5.23),Yellow Earths (Gn2.84, Gn2.94), Siliceous Sands (Ue 1.21) on slopes; deep (>200 cm) Leached Sands (Uc 2.12), Podzols (Uc2.32, Uc2.36) and Grey Earths (Gn2.81) on valley floors.
Hawkesbury	Lugged, rolling to very steep hills on Hawkesbury Sandstone. Local relief 40-200m, slopes >25% Rock outcrop >50%. Narrow crests and ridges, narrow incised valleys, steep sideslopes with rocky benches, broken scarps and boulders. Mostly uncleared eucalypt open-woodland (dry sclerophyll forest) and tall open-forest (wet sclerophyll forest).	Shallow (>50 cm), discontinuous Lithosols, Siliceous Sands (Ucl.21) associated with rock outcrop; Earthy Sands (Uc5.11, Uc5.23), Yellow Earths (Gn2.24) and some Yellow Podzolic Soils (Dy4.11) on inside of benches and along joints and fractures; localised Yellow and Red Podzolic Soils (Dy4.11, Dy5.21, Dr5.11, Dr5.21) associated with shale lenses; Siliceous Sands (Uc1.2) and secondary Yellow Earths (Gn2.41) along drainage lines.
Gymea	Undulating to rolling rises and low hills on Hawkesbury Sandstone. Local relief 20-80m, slopes 10-25%. Rock outcrop <25%. Broad convex crests, moderately inclined side slopes with wide benches, localised rock outcrop on low broken scarps. Extensively cleared open-forest (dry sclerophyll forest) and eucalypt woodland.	Shallow to moderately deep (30-100 cm) Yellow Earths (Gn2.24) and Earthy Sands (Uc5.11, Uc5.23) on crests and inside of benches; shallow (<20 cm) Siliceous Sands (Ucl.21) on leading edges of benches; localized Gleyed Podzolic Soils (Dg4.21) and Yellow Podzolic Soils (Dy4.11, Dy5.11, Dy5.4V on shale lenses; shallow to moderately deep (<100 cm) Silkeous Sands (Ucl.1.2) and Leached Sands (Uc2.21) along drainage lines.

3. PRECINCT DEVELOPMENT AND STAGING

3.1. Infrastructure Delivery Plan

DP&E engaged Cardno to provide engineering services to assist in the preparation of an Infrastructure Delivery Plan (IDP) for the Ingleside Precinct. The primary objective of the IDP is to assist in nominating the long-term and short-term utility infrastructure strategies that will support the future development of the Precinct.

3.2. Staging

This report is based on servicing strategies identified by Sydney Water. Sydney Water has completed the high level servicing strategy for potable water-and waste water services to the Ingleside.

3.3. Water Supply

The Precinct is partly covered by two of Sydney Water's nominated water supply zones:

- Elanora Heights
- Minkara.

There remains a significant area within the Precinct that is not currently serviced with potable water. Refer to the Cardno Infrastructure Delivery Plan for details.

3.4. Wastewater

The study area does not currently have any connections to the Sydney Water wastewater network and it is anticipated that existing land users rely upon on site disposal systems. It is assumed for the purposes of this report that the study area is already serviced by on site effluent management systems.

4. SITE SUITABILITY ASSESSMENT PARAMETERS

4.1. Rainfall and Evaporation

Climate data available from the Bureau of Meteorology (BOM) (2015) for Observatory Hill in inner Sydney provided the closest weather station to the study areas with records of evaporation as well as rainfall. Data was analysed for the year to February 2015 in order to analyse the balance between rainfall and evaporation which has been summarised in the Table 2 below. Rainfall data from Terrey Hills AWS has also been included for comparative purposes as it is the closest weather station to the study areas just measuring rainfall for the year February 2015.

Table 2. Rainfall and evaporation data for Terrey Hills.

Month	Monthly Rainfall Total (mm)*	Monthly Rainfall Total (mm)**	Monthly Pan Evaporation Total (mm)**	Monthly Water Balance (Evaporation – Rainfall) (mm)**
March 2014	139.6	102.6	159.4	56.8
April 2014	70.6	121.0	110.4	-10.6
May 2014	20.0	27.4	113.6	86.2
June 2014	83.6	68.0	99.4	31.4
July 2014	13.6	16.4	97.4	81.0
August 2014	235.6	215.2	100.4	-114.8
September 2014	71.0	50.4	141.2	90.8
October 2014	64.4	86.6	187.0	100.4
November 2014	28.0	16.0	218.4	202.4
December 2014	167.0	118.0	231.6	113.6
January 2015	187.6	165.8	228.0	62.2
February 2015	49.2	59.0	177.8	118.8

Key:
** Terrey Hills AWS*
*** Observatory Hill AWS*

Table 2 highlights that the study area generally has higher monthly evaporation than the respective monthly rainfall. This indicates the hydraulic load could potentially be utilised for sub-surface irrigation. It is important to note that during periods of wet weather, treated wastewater must be stored and not applied to the ground. Application of wastewater during wet weather could result in pollutants leaching into the groundwater, or the wastewater could resurface creating a range of environmental and health risks.

4.2. Temperature

The average maximum daily temperatures during the winter months (June, July and August) in the Sydney region are between 15 and 18 degrees Celsius, as shown on mapping from the BOM (2011). Temperature data can be referenced in Appendix D. These maps are based upon the 30-year period from 1961-1990. Recent climate data was sourced from the BOM to compare with these averages from Terrey Hills which is the closest available weather station to Ingleside. The Terrey Hills weather station is located less than three kilometres to the west of the Wirreanda Valley Precinct. Average daily maximum temperatures for June, July and August 2014 were 17.3, 16.9, 16.2 degrees Celsius respectively. The *Environment & Health Protection Guidelines for On-site Sewage Management for*

Single Households (Department of Local Government, 1998) state that average maximum daytime temperatures below 15 degrees Celsius decrease the performance of wastewater treatment processes. The average daily maximum temperatures for the study area are not below this threshold.

4.3. Environmental Buffer Distances

Buffer distances adopted for this study are based on the recommended distances in the *Environment & Health Protection Guidelines for On-site Sewage Management for Single Households* (Department of Local Government, 1998). Buffer distances adopted comprised:

- 250 metres between a land application area and a groundwater well used for domestic water supply
- 100 metres to permanent surface waters (eg river, streams, lakes, etc)
- 40 metres to other waters (eg farm dams, intermittent waterways and drainage channels, etc)
- 6 metres if area up-gradient and 3 metres if area down-gradient of swimming pools, property boundaries, driveways and buildings.

Due to the high number of registered bores within the study area, two environmental buffer calculations have been provided for discussion within this section of the study:

- All groundwater bores are being used for domestic purposes, refer to Table 3 and Figure 2
- No groundwater will be used for domestic purposes within the study area. Properties are connected to potable water mains and therefore the 250 m buffer may not apply, refer to Table 4 and Figure 3.

In the event that groundwater is required for domestic purposes within the Ingleside Release area, an additional buffer of 250 m from any land application system must be allowed for in buffer calculations when assessing available land for managing on site effluent capabilities. This buffer layer has significant impact on the amount of available assessment land within the study area. This buffer calculation reduces the land available for assessment for potential onsite effluent management to 41.6 hectares of land from an original study area of 132 hectares. Application of this buffer reduces available land most significantly in North Ingleside area where only 7% of the study area is remaining available for additional assessment if this buffer is applied.

Table 3. Study area breakdown for unconstrained and constrained land based on 250 m buffer for domestic use of groundwater (Department of Local Govt. 1998).

Study Area	Available (ha)	Area not affected by groundwater bore environmental buffer		Constrained Area (to be excluded from onsite effluent management)	
		ha	% of Total Area*	ha	% of Total Area*
Wirreanda Valley	75.5	16.4	22	59	78
North Ingleside Precinct	17.5	1.2	7	1.2	93
Bayview Precinct	39.2	24	61	15.2	39
TOTAL	132.2	41.6	31	90.6	69

*% area is calculated from original study area of 132.2 ha from Table 4

Last updated by: RC10721 on 15/06/2015 at 15:05

It is likely that a number of the registered bores are no longer operational or required in future as a domestic water source. Applying this buffer layer as a default requirement may not represent the current status of groundwater bore requirements in the study area, however the status of each groundwater bore at each site will need to be established at a site specific scale assessment if buffer is to be removed from the environmental constraints calculations.

In the event that the additional assessment can establish that no groundwater bores are being used for domestic purposes (or domestic use groundwater bores are decommissioned) and areas of assessment will be connected to potable water mains at each site, then calculations for land that may be assessed for onsite effluent management potential within the study area increases to 84.3 hectares.

The spatial analysis applied using the buffer distances in Table 4 and Figure 3, are undertaken with the adopted buffer criteria, however without the groundwater bore buffer being applied. This calculated data is based on subsurface irrigation (Table 5) for onsite systems in order to determine the area that is unconstrained for further assessment of onsite effluent constraints.

Table 4. Study area breakdown for unconstrained and constrained land based on adopted buffers (Department of Local Government, 1998).

Total Study Area (ha)	Unconstrained Area (available for onsite effluent management)		Constrained Area (to be excluded from onsite effluent management)	
	ha	% of Total Area	ha	% of Total Area
132.2	84.3	64	47.9	36

The buffer distances highlighted in Table 4 indicates that 47.9 hectares of the study area has constraints and should be excluded from further consideration in managing on site effluent requirements. The remaining 84.3 hectares presents some potential for onsite effluent to be managed and an appropriate system selection process may proceed in these areas. Constrained and unconstrained areas are mapped in Figure 3.

4.4. Exposure, Slope and Landform

The slope assessment was undertaken on the area of unconstrained area as a result of the buffer distance analysis (i.e. 84.3 hectares of a total possible area of 132.2 hectares). A system limitation rating is listed in Table 5 and is based on the *Environment & Health Protection Guidelines for On-site Sewage Management for Single Households* (Department of Local Government, 1998) provides the categories for slope assessment surface irrigation, subsurface irrigation and absorption systems.

Table 5. Site Assessment Ratings for On site Systems.

Slope %	Minor Limitation	Moderate Limitation	Major Limitation
Surface Irrigation	0-6	6-12	>12
Subsurface Irrigation	0-10	10-20	>20
Absorption System	0-10	10-20	>20

Due to the broad scale of this report, this study has adopted the subsurface and absorption system as a typical on-site system required in a low density rural setting. Site assessment has identified run-off and erosion as the most likely broad scale restrictive feature of the study area based on the high

proportion of sloping land. The Slope % Limitation is illustrated in Figure 3 and is identifying the calculated land areas identified with minor, moderate or major limitations provided in Table 6. Additional specific assessment for system selection maybe required to establish appropriate system selection where the localised landform, site drainage, presence of fill, rocks and out crops may also present additional system limitations.

Table 6. Unconstrained land with minor, moderate or major limitations for subsurface irrigation systems (Department Local Government, 1998).

Study Area	Available (ha)	Minor Limitation (0-10% Slope)		Moderate Limitation (10-20 % Slope)		Major Limitation (>20% Slope)	
		ha	% Area*	ha	% Area*	ha	% Area*
Wirreanda Valley	45	20.2	27	16.6	22	7.7	10
North Ingleside Precinct	10	3.9	23	4.4	25	1.7	10
Bayview Precinct	30	17.8	45	7.5	19	4.4	11
TOTAL	84	42	32	29	22	14	10

*% area is calculated from original study area of 132.2 ha from Table 4

4.5. Flood Potential

Pittwater Council does not have flood risk mapping as part of its Local Environmental Plan. A flood study undertaken by Cardno in 2013 on behalf of Pittwater Council was instead used to interpret the flood potential across the study areas. The modelling undertaken for the Ingleside area utilised the 1 in 20 year 'blocked' scenario which was also identified as being equivalent to the 1 in 100 year 'unblocked' scenario.

There is no area within the unconstrained areas that were mapped as having overland flow depths of greater than 0.3m as these areas corresponded to those that have already been constrained by buffer distances analysed in Section 4.3. However, there are a number of small isolated pockets within the remaining unconstrained areas that were mapped as having overland flow depths from the specified flood event of between 0.15 m and 0.3 m. These areas have been calculated and categorised as now constrained. This is in accordance with the recommendations in the Environment & Health Protection Guidelines for On-site Sewage Management for Single Households that on-site systems and their components should be located "above the 1 in 100 year probability flood contour".

4.6. Run-On and Seepage

Run-on of precipitation on to the land application area from up-gradient areas should be avoided. Run-on should be diverted around any land application area by using earthworks or a drainage system approved by the local council.

Upslope seepage can be at least partly controlled by installing groundwater cut-off trenches, provided the lowest level of the trench is above the level at which effluent can enter the land application area.

On-site systems should not be installed on damp sites. Poor drainage and surface dampness are often indicated by the type of vegetation growing on the site. Sedges and ferns are likely to grow in damp conditions. Seepage springs and soaks are also indications of poor site drainage. Assessment of this limitation is to be conducted a site specific level assessment.

4.7. Erosion Potential

The subject area is considered to present as a high erosion hazard due to the typical characteristics of a colluvial and erosional soil landscapes combined with high rainfall intensity which can generate high soil loss. This high erosional hazard implies that significant erosion will occur during development and after land use is established, even with intensive soil conservation measures. Such erosion hazards infers that planning will need to carefully consider the balance between the probability of long term erosion damage and maintenance or repair needed to ensure the viability of the onsite effluent management application areas and establishment of viable vegetative cover. Where practicable, design and construction of waste water systems should aim to minimise hydraulic loads to minimise the potential for soil loss by throughout the operational life of the system.

The likely soil loss rates for soil landscape observed in the study area are listed in Table 7. Erosion and sediment runoff is more likely when clay content is high and is more likely when the dispersion percentage is also high and should be managed with caution when effluent is land applied to ensure surface runoff is prevented. Soil landscape as they occur in within the study area can be viewed in Figure 4.

Table 7. Soil erosion potential.

Soil Type	Limitations
Somersby	Localised permanently high water tables, areas of laterite and stony soil, very low soil fertility, highly permeable soil and slightly reactive Soil Loss 58 t/ha for topsoil and 162 t/ha for subsoil
Oxford Falls	**Very high soil erosion hazard**, perched water tables and swamps, highly permeable soil, very low to low soil fertility, localised rock outcrop. Moderately reactive Soil Loss 91 t/ha for topsoil and 131 t/ha for subsoil
Hawkesbury	**Extreme soil erosion hazard**, mass movement (rock fall) hazard, steep slopes, rock outcrop, shallow, stony, highly permeable soil, low soil fertility. Slightly reactive Soil Loss 109 t/ha for topsoil and 394 t/ha for subsoil
Gymea	Localised steep slopes, high soil erosion hazard, rock outcrop, shallow highly permeable soil, very low soil fertility. Slightly reactive Soil Loss - 19 t/ha for topsoil and 464 t/ha for subsoil

5. SITE INVESTIGATION

5.1. Investigation Methodology

The principal objective of the field investigation was to assess the physical and chemical constraints of the soil landscapes for the purposes of onsite effluent management systems within the study area.

SMEC identified sample locations for each sub-precinct to represent each main soil landscape type as they occurred in the study area and at the sampling density required to support subdivision scale of assessment. Each sub precinct was sampled in following way:

- Wirreanda Valley – Six locations
- North Ingleside – Three locations
- Bayview – Four locations

These locations can be viewed in Figure 4.

Each soil sample location was augured by a utility-mounted drill rig to 1.2 metres or the restrictive horizon (for example, the hardpan or standing watertable), whichever was the shallower. Hand auger was used in locations where vehicle access was not possible.

Samples were taken for each topsoil and subsoil soil horizon, and analysed for the following parameters:

- Bulk density (topsoil and subsoil)
- Soil pH (1:5 soil:water) - (topsoil and subsoil)
- Electrical conductivity(1:5 soil:water) (topsoil and subsoil)
- Conversion to ECe - (topsoil and subsoil)
- Cation exchange capacity and exchangeable cations, exchangeable sodium percentage - (topsoil and subsoil)
- Phosphorus sorption (topsoil)
- Modified Emerson aggregate test (SAR 5) - (topsoil and subsoil)
- Particle size analysis (hydrometer) - (topsoil)
- Saturated hydraulic conductivity – (interpretive only)

Linear shrinkage testing was not conducted in this assessment as these soils surveyed are not associated with a shrink swell constraints.

SMEC undertook the works in accordance with a site specific Job Safety and Environmental Analysis (JSEA) Plan. The aim of the plan was to manage the potential risks to human health and safety associated with fieldwork activities. All fieldwork was undertaken by suitably qualified, trained and experienced personnel.

5.2. Site Observations – Soil Profile

The targeted borehole soil sampling study conducted by SMEC included an analysis of the types of soil encountered at each sampling location at varying depths. Fill material was encountered at seven of the boreholes drilled. The following table summarises the boreholes drilled and depths that fill material was encountered, if at all. Soil profile logs can be viewed in Appendix A.

Table 8. Borelog summary of fill materials encountered.

Borehole ID	Depth(s) of Fill (mbgl)
SB1	0 – 0.15
SB2	Not encountered
SB4	0 – 0.2
SB5	0.1 – 1.0
SB6	0 – 1.2
SB7	0 – 0.8
SB8	Not encountered
SB9	0 – 0.7
SB10	Not encountered
SB11	0 – 0.4
SB12	Not encountered

The Environment & Health Protection Guidelines for On-site Sewage Management for Single Households states that depths of fill material less than 0.3 metres deep may be suitable for on-site effluent management however also depends on the nature of the fill material and suitability of the underlying soil.

Boreholes SB1, SB2, SB4, SB8, SB10 and SB12 satisfy this guideline depth for fill material.

5.3. Surface Rocks

The Environment & Health Protection Guidelines for On-site Sewage Management for Single Households notes that the presence of rock outcrops usually indicates highly variable bedrock depths. This can be associated with preferential pathways (short-circuits) for effluent to flow along rock fissures and surface elsewhere.

The site inspection undertaken by SMEC observed the presence of localised rock outcrops in a range of locations within the study areas. The eastern side of Addison Road in Wirreanda Valley Precinct was observed to contain rock outcrops in areas and with steep slopes. Rock outcrops were also easily observed in the Bayview Precinct. Similarly to Wirreanda Valley, rock outcrops were commonly observed in areas of relatively steeper slopes.

The presence of rocks can limit evaporation and interfere with drainage. Rocks can also interfere with trench and pipe installations. Cobbles and larger stones can collapse into installations, causing problems with even effluent distribution.

5.4. Groundwater

Groundwater was not encountered during this survey, however it is likely that these soil landscape experience seasonably variable perched and localised water tables.

6. ANALYTICAL SOIL ASSESSMENT

6.1. Soil Chemistry Assessment

The purpose of testing the soils within the study area was to determine the potential for the application of effluent to land aiming to minimise any adverse environmental impacts. Such factors as high or excessive nitrogen levels or lack of any phosphorus retention capacity would limit effluent application. Full nutrient soil test results and how they are interpreted against the adopted guidelines area located in Table 1 Appendix B. Laboratory certificates are located in Appendix C.

The laboratory data show soils assessed exhibit strong acidity (range from 4.3 to 7.8 (pH in $CaCl_2$)) for both topsoil and subsoil), with low phosphorus retention levels (average 750kg/Ha (150mm depth) and six areas already exceeding their capacity to retain any additional phosphorus.

6.2. Soil Physical Assessment

The purpose of testing the soils within the study area was to determine the potential for the application of effluent to land and aiming to minimising any adverse environmental impacts. Such factors as depth to bedrock, presence of episodic water table, soil dispersiveness, soil permeability and bulk density will influence retention time of effluent to be improved and for stabile soil conditions to be maintained over the life of the asset. Full nutrient summary of soil physical test results are provided in Table 1 Appendix B.

All soils over time may be influenced by effluent chemistry and their susceptibility to disperse in effluent slowly increases. This effect is not only a function of the effluent, particularly SAR and EC effects. The modified Emerson Aggregate Test (mEAT) is designed to help classify the structural stability of a soil aggregate (ped) under effluent applications, and indicate the effects of physical manipulation (cultivation) on soil at an elevated moisture level. Structural stability is essential for macroporosity, the pathway of water movement through soil (drainage), while microporosity functions by capillary action, holding plant available water. Both these processes are important for effluent disposal into the soil profile.

Assessment of the mEAT results is reasonable with a range of Class 4 to Class 7 demonstrate the soil are generally non dispersive (Class 4) to aggregates that swell but remain coherent (Class 8). The Sandy clay soils however have insufficient particle size range and creates soil permeability issues. These soils may require amelioration or special treatment of the soil to overcome the potential for reduced permeability.

6.3. Summary of Results

SMEC undertook a site inspection and soil sampling in March 2015. Analysis was then carried out on the soil samples for their suitability for effluent disposal. Table 9 shows the summary classification of the soil testing conducted by SESL Pty Ltd. The summary of soil testing results and land slope constraints are mapped in Figure 5 and supported by laboratory result table and interpretation of that data in accordance with the adopted criteria in Table 1 Appendix B. Laboratory Test certificates are located in Appendix C.

Table 9. Soil analysis summary table.

Sample ID	Sample Depth	Physical Limitations	Chemical Limitations
SB1	0.1	Minor	Major - Phosphorus

7. CONCLUSIONS AND RECOMMENDATIONS

7.1. Environmental Buffers and Slope Constraints

The study area used in this assessment is approximately 132.2 hectares in size. In the event that all adopted environmental buffers are applied, then the available area for subsequent environmental constraint assessment is reduced by 69% to an approximate 41.6 hectares remaining for onsite effluent system selection assessment. The major constraint in this buffer calculation is due to the inclusion of a 250 m buffer resulting from groundwater bores that may potentially be used for domestic purposes. This groundwater bore setback reduces potential remaining suitable areas for effluent management of the sub precincts areas to less than 7% for North Ingleside, 22% for Wirreanda Valley and 61% for Bayview. It is likely that these numbers will be further reduced once site specific constraints are applied like slope, soil depths and building footprints.

In the event that groundwater bores used for domestic purposes can be demonstrated as non operational, not required as future sources of domestic water supply in proposed landuses and able to be removed from the buffer calculation, the potential study area is increased by approximately 36% to 84 hectares. Slope constraints and other adopted setbacks when applied to remaining available (84 ha) areas result in a further reduction of viable sites in accordance with the risk spectrum of minor constraints representing 32% (42 ha) of the study area, moderate constraints representing 22% (29 ha) of the study area and major limitations representing 10% (14 Ha).

Individual site assessment will be required to take into account the remaining capacity for each site to manage onsite effluent. It is likely that specific site assessment may identify specific constraints and onsite effluent system efficiencies not observed at the subdivision scale of assessment conducted in this report.

7.2. Site Observations

The site survey identified seven out of twelve locations to contain fill materials overlaying natural soil horizons. These fill layers are generally associated with localised cut and fill activities associated with the immediate landuse of the site. Fill material less than 0.3 metres deep may be suitable for on-site effluent management however also depends on the nature of the fill material and suitability of the underlying soil.

The site survey observed the presence of rock outcrops in a range of locations within the study areas. The eastern side of Addison Road in Wirreanda Valley Precinct was observed to contain rock outcrops in areas with steep slopes. Rock outcrops were also easily observed in the Bayview Precinct. Similarly to Wirreanda Valley, rock outcrops were commonly observed in areas of relatively steeper slopes.

7.3. Soil Analysis – Physical

The purpose of testing the soils within the study area was to determine the potential for the application of effluent to land and aiming to minimising any adverse environmental impacts.Soil permeability represents a moderate to major limitation across the study area.

7.4. Soil Analysis – Chemical

Based on the phosphorous loading, it appears that the likely phosphorus load normally associated with effluent water will be a major limiting factor for the study area at a subdivision scale. Therefore, the effluent disposal area must be sized accordingly at a site specific assessment scale. In site specific application nutrient loads and hydraulic loads may be managed in a way to minimise this limitation.

Existing soil nutrient loading represents a major limitation across the study area.

7.5. Soil Improvements

Soil improvements should be made within the likely irrigation areas to enhance the uptake of nutrients and ensure the ongoing absorption of effluent to vegetation on site. The main objective is to increase the pH of the soil by the addition of lime to the topsoil.

7.6. Potential Health and Environmental Impacts

The potential environmental impacts concerned with the proposed On Site Effluent Systems for this subdivision are:

- Health concerns for residents: the large land requirements associated with land application area associated with poor nutrient retention to prevent surface discharge of effluent may not be available.
- Contamination of sensitive environments (i.e. watercourse and reserve vegetation) due to poor nutrient retention properties and shallow soils.

7.7. Recommendation

In the event that groundwater is required for domestic purposes within the Ingleside Release area, an additional buffer of 250 m from any land application system must be allowed for in buffer calculations when assessing available land for managing on site effluent capabilities. Application of this buffer layer has significant impact on the amount of available assessment land within the study area. This buffer calculation reduces the land available for assessment for potential onsite effluent management to 41.6 hectares of land from an original study area of 132 hectares. Application of this buffer reduces available land most significantly in North Ingleside area where only 7% of the study area is remaining available for additional assessment if this buffer is applied.

It is likely that a number of the registered bores are no longer operational or required in the future as a domestic water source, however, even if the domestic use of groundwater buffer is removed from the environmental constraint list, this assessment has identified that 32% of the study area has a minor slope limitation and 100% of the topsoil sample locations represent a major limitation with regard to existing phosphorus loading.

Moderate limitations can be overcome by appropriate selection, design, and sizing of on-site systems, or by modifying the site. Areas where sites are limiting or unsuitable for the installation of on-site systems should be avoided.

The soil landscapes within the study area present a number of soil-related environmental constraints for on-site sewage management systems. Soil depths across the study area can be highly variable. The Hawkesbury Soil Landscape is characterised by sandstone outcrops in sloped areas. Soil depths of less than 0.6 metres to bedrock may not have enough capacity to filter nutrients and pathogens. Shallow soil often has a highly variable depth, and incurs a risk of effluent surfacing near the land application area.

The soils assessed identified that phosphorus loading is already an issue and may not have any capacity to improve the effluent prior to leaving the source site. Any decisions about the on-site management of sewage and system selection should consider these potential impacts and constraints. Ideally the evaluation proceeds from a more detailed site specific assessment.

The identified constraints currently limit the use of conventional effluent management practices unless detailed assessment is conducted at the lot scale.

Collectively, landowners within each of the study areas (Wirreanda Valley, North Ingleside and Bayview) may consider options for alternate or centralised solutions aimed towards the selection of a suitable site specific system that minimises the areas considered not suitable for conventional effluent management practices.

Recommendations

Total Nitrogen: 0.15%

For the purpose of onsite effluent disposal report, this soil shows slight acidity and low salinity. The soils ability to absorb phosphorus is very low. The negative value obtained PRI generally indicates the sample is saturated with Total Phosphorus or Available Phosphorus, rendering the sample unsuitable for this test.

The Emerson Stability Class indicates soil aggregates disperse when the water content intermediates between field capacity and that of suspension. Materials disperse when severely provoked by dilution into slurry form combined with significant mechanical action. They represent a much lower erosion risk on exposed soil but will erode if raindrop impact and running water are combined. Precautions to reduce the velocity of running water (i.e. soil conservation structures, roughened surface etc) should be employed where there is a risk (i.e. long slopes). This soil poses slight to nil limitations to effluent disposal depending on topography.

Please note only particle size analysis via hydrometer was conducted and repacked density was conducted as sample was not suitable for wax block density.

Total Nitrogen: 0.04%
For the purpose of onsite effluent disposal report, this soil shows moderate acidity and very low salinity. The soils ability to absorb phosphorus is very low but to depth of 150mm can absorb a considerable amount, increasing the longevity of the effluent disposal system.
The Emerson Stability Class indicates soil aggregates disperse when the water content intermediates between field capacity and that of suspension. Materials disperse when severely provoked by dilution into slurry form combined with significant mechanical action. They represent a much lower erosion risk on exposed soil but will erode if raindrop impact and running water are combined. Precautions to reduce the velocity of running water (i.e. soil conservation structures, roughened surface etc) should be employed where there is a risk (i.e. long slopes). This soil poses slight to nil limitations to effluent disposal depending on topography
The low pH and extremely available aluminium is the main limitation to effluent disposal. As such, a lime application is required:
- Incorporate 40g/sqm of lime into the soil in order to increase pH and reduce available aluminium.
Please note only particle size analysis via hydrometer was conducted and repacked density was conducted as sample was not suitable for wax block density.

Recommendations

For the purpose of onsite effluent disposal report, this soil shows strong acidity and very low salinity. The soils ability to absorb phosphorus is low but to depth of 150mm can absorb a considerable amount, increasing the longevity of the effluent disposal system.

The Emerson Stability Class indicates soil aggregates, in suspension, flocculate completely after standing for five minutes. Aggregates in this class are mechanically weak (slaking) but chemical conditions are such that colloids will not disperse even if severely provoked. A minimum of precaution in ploughed fields to prevent long runoff slopes is required. This soil poses slight to nil limitations to effluent disposal depending of topography.

Recommendations

For the purpose of onsite effluent disposal report, this soil shows very slight acidity and low salinity. The soils ability to absorb phosphorus is very low but to depth of 150mm can absorb a considerable amount, increasing the longevity of the effluent disposal system.

The Emerson Stability Class indicates soil aggregates do not disperse after remoulding at field capacity. This represents a more stable class of aggregate that is kept from dispersing by the presence of gypsum of high soluble calcium content. Only likely to erode if exposed to mechanical action of rainfall or running water of sufficient velocity to carry the particle size contained. This soil poses slight to nil limitations to effluent disposal depending on topography.

Recommendations

Total Nitrogen:0.05%
For the purpose of onsite effluent disposal report, this soil shows very slight acidity and very low salinity. The soils ability to absorb phosphorus is very low. The negative value obtained PRI generally indicates the sample is saturated with Total Phosphorus or Available Phosphorus, rendering the sample unsuitable for this test.
The Emerson Stability Class indicates soil aggregates disperse when the water content intermediates between field capacity and that of suspension. Materials disperse when severely provoked by dilution into slurry form combined with significant mechanical action. They represent a much lower erosion risk on exposed soil but will erode if raindrop impact and running water are combined. Precautions to reduce the velocity of running water (i.e. soil conservation structures, roughened surface etc) should be employed where there is a risk (i.e. long slopes). This soil poses slight to nil limitations to effluent disposal depending on topography

Please note only particle size analysis via hydrometer was conducted and repacked density was conducted as sample was not suitable for wax block density.

Total Nitrogen: 0.06%
For the purpose of onsite effluent disposal report, this soil shows medium acidity and very low salinity. The soils ability to absorb phosphorus is very low but to depth of 150mm can absorb a considerable amount, increasing the longevity of the effluent disposal system.
The Emerson Stability Class indicates soil aggregates swell but remain coherent. The most stable class of aggregates most suitable to cropping and cultivation.
Very few erosion problems but swelling aggregates can be mechanically weak and should not be trafficked or ploughed when at or above field capacity.
The unbalanced soil chemistry is the main limitation to effluent disposal. The low pH and extremely available aluminium is likely to significantly restrict plant growth.
As such, the following corrective actions are recommended:
- Incorporate 50g/sqm of lime into the soil in order to increase pH and reduce available aluminium
- Incorporate 10g/sqm of gypsum into the soil in order to increase calcium level and improve cation balance
Please note only particle size analysis via hydrometer was conducted and repacked density was conducted as sample was not suitable for wax block density.

Recommendations

For the purpose of onsite effluent disposal report, this soil shows strong acidity and very low salinity. The soils ability to absorb phosphorus is low but to depth of 150mm can absorb a considerable amount, increasing the longevity of the effluent disposal system.

The Emerson Stability Class indicates soil aggregates, in suspension, flocculate completely after standing for five minutes. Aggregates in this class are mechanically weak (slaking) but chemical conditions are such that colloids will not disperse even if severely provoked. A minimum of precaution in ploughed fields to prevent long runoff slopes is required. This soil poses slight to nil limitations to effluent disposal depending of topography.

For the purpose of onsite effluent disposal report, this soil shows slight alkalinity and low salinity. The soils ability to absorb phosphorus is low but to depth of 150mm can absorb a considerable amount, increasing the longevity of the effluent disposal system.

The Emerson Stability Class indicates soil aggregates do not disperse after remoulding at field capacity. This represents a more stable class of aggregate that is kept from dispersing by the presence of gypsum of high soluble calcium content. Only likely to erode if exposed to mechanical action of rainfall or running water of sufficient velocity to carry the particle size contained. This soil poses slight to nil limitations to effluent disposal depending on topography.

Please note only particle size analysis via hydrometer was conducted and repacked density was conducted as sample was not suitable for wax block density.

For the purpose of onsite effluent disposal report, this soil shows very slight acidity and very low salinity. The soils ability to absorb phosphorus is low but to depth of 150mm can absorb a considerable amount, increasing the longevity of the effluent disposal system.

The Emerson Stability Class indicates soil aggregates swell but remain coherent. The most stable class of aggregates most suitable to cropping and cultivation. Very few erosion problems but swelling aggregates can be mechanically weak and should not be trafficked or ploughed when at or above field capacity.

Please note only particle size analysis via hydrometer was conducted and repacked density was conducted as sample was not suitable for wax block density.

Recommendations

For the purpose of onsite effluent disposal report, this soil shows slight alkalinity and very low salinity. The soils ability to absorb phosphorus is very low but to depth of 150mm can absorb a considerable amount, increasing the longevity of the effluent disposal system.

The Emerson Stability Class indicates soil aggregates disperse when the water content intermediates between field capacity and that of suspension. Materials disperse when severely provoked by dilution into slurry form combined with significant mechanical action. They represent a much lower erosion risk on exposed soil but will erode if raindrop impact and running water are combined. Precautions to reduce the velocity of running water (i.e. soil conservation structures, roughened surface etc) should be employed where there is a risk (i.e. long slopes). This soil poses slight to nil limitations to effluent disposal depending on topography.

Total Nitrogen: 0.05%
For the purpose of onsite effluent disposal report, this soil shows slight alkalinity and very low salinity. The soils ability to absorb phosphorus is very low. The negative value obtained for PRI generally indicates the sample is saturated with Total Phosphorus or Available Phosphorus, rendering the sample unsuitable for this test.

The Emerson Stability Class indicates soil aggregates do not disperse after remoulding at field capacity. This represents a more stable class of aggregate that is kept from dispersing by the presence of gypsum of high soluble calcium content. Only likely to erode if exposed to mechanical action of rainfall or running water of sufficient velocity to carry the particle size contained. This soil poses slight to nil limitations to effluent disposal depending on topography.

Please note only particle size analysis via hydrometer was conducted and repacked density was conducted as sample was not suitable for wax block density.

Recommendations

For the purpose of onsite effluent disposal report, this soil shows slight alkalinity and very low salinity. The soils ability to absorb phosphorus is very low but to depth of 150mm can absorb a considerable amount, increasing the longevity of the effluent disposal system.

The Emerson Stability Class indicates soil aggregates disperse when the water content intermediates between field capacity and that of suspension. Materials disperse when severely provoked by dilution into slurry form combined with significant mechanical action. They represent a much lower erosion risk on exposed soil but will erode if raindrop impact and running water are combined. Precautions to reduce the velocity of running water (i.e. soil conservation structures, roughened surface etc) should be employed where there is a risk (i.e. long slopes). This soil poses slight to nil limitations to effluent disposal depending on topography.

Total Nitrogen: 0.13%
For the purpose of onsite effluent disposal report, this soil shows strong acidity and very low salinity. The soils ability to absorb phosphorus is very low but to depth of 150mm can absorb a considerable amount, increasing the longevity of the effluent disposal system.

The Emerson Stability Class indicates soil aggregates swell but remain coherent. The most stable class of aggregates most suitable to cropping and cultivation. Very few erosion problems but swelling aggregates can be mechanically weak and should not be trafficked or ploughed when at or above field capacity.

The low pH and extremely available aluminium are the main limitations to effluent disposal. As such, a lime application is required:
- Incorporate 160g/sqm of lime into the soil in order to increase pH and reduce available aluminium

Please note only particle size analysis via hydrometer was conducted and repacked density was conducted as sample was not suitable for wax block density.

Recommendations

For the purpose of onsite effluent disposal report, this soil shows strong acidity and very low salinity. The soils ability to absorb phosphorus is very low but to depth of 150mm can absorb a considerable amount, increasing the longevity of the effluent disposal system.

The Emerson Stability Class indicates soil aggregates disperse when the water content intermediates between field capacity and that of suspension. Materials disperse when severely provoked by dilution into slurry form combined with significant mechanical action. They represent a much lower erosion risk on exposed soil but will erode if raindrop impact and running water are combined. Precautions to reduce the velocity of running water (i.e. soil conservation structures, roughened surface etc) should be employed where there is a risk (i.e. long slopes). This soil poses slight to nil limitations to effluent disposal depending on topography.

Drillers Log

From (m)	To (m)	Thickness(m)	Drillers Description	Geological Material	Comments
0.00	0.50	0.50	topsoil	Topsoil	
0.50	13.00	12.50	sandstone, yellow	Sandstone	
13.00	13.50	0.50	clay	Clay	
13.50	22.00	8.50	sandstone, yellow	Sandstone	
22.00	22.50	0.50	sandstone, quartz	Sandstone	
22.50	23.00	0.50	clay	Clay	
23.00	43.00	20.00	sandstone, yellow	Sandstone	
43.00	52.50	9.50	sandstone, quartz	Sandstone	
52.50	55.50	3.00	sandstone, grey	Sandstone	
55.50	56.50	1.00	shale, soft	Shale	
56.50	58.50	2.00	sandstone, quartz	Sandstone	
58.50	64.50	6.00	shale, clay band	Shale	
64.50	74.00	9.50	sandstone, grey	Sandstone	
74.00	77.00	3.00	shale, soft	Shale	
77.00	89.00	12.00	sandstone, grey	Sandstone	
89.00	91.00	2.00	sandstone, quartz	Sandstone	
91.00	94.00	3.00	sandstone, grey	Sandstone	
94.00	95.00	1.00	sandstone, clay band	Sandstone	
95.00	98.00	3.00	sandstone, grey	Sandstone	
98.00	98.50	0.50	sandstone, quartz	Sandstone	
98.50	100.50	2.00	sandstone, grey	Sandstone	
100.50	102.00	1.50	sandstone, clay band	Sandstone	
102.00	121.00	19.00	sandstone, grey	Sandstone	
121.00	125.00	4.00	shale	Shale	
125.00	145.00	20.00	sandstone, grey	Sandstone	
145.00	146.00	1.00	shale	Shale	
146.00	180.00	34.00	sandstone, grey	Sandstone
